Lab 9 CheckIn – Oliver Wuttke (WUTT0019)

Question 1 – Progress

What did you accomplish this week? Any issues slowing down progress?

Did the lab, started experimenting with some ML models for A2. Nothing much slowing down progress felt like the lab was pretty straightforward.

Question 2 – Plans

What are your goals for next week? How does this match against your overall project plan?

Finalise models for A2 and start actually writing some code for the final A2 part. Goes well with project plan as its required

Question 3 – Study

List and discuss the three main points of material covered this week.

1. Search and Optimisation – Lots hear looked a variety of search and heuristic methods for search and how they work. Also did a cool look into your research with multi-objective dynamic optimisation problems mainly looking at the particle swarm and genetic algorithms.
2. More Prolog – Lab focused on parsing with a CFG defined in prolog which was cool.

I know it's only two but that's kind of the two main things.

Question 4 – Insights

What was the single most confusing concept ("muddiest point") for you in this week's material, and what specific question do you have about it?

The advanced particle swarm for dynamic problems was a bit tricky to understand with the sentinel, but I think I get the idea (sort of). I don't really have a specific question about it rather than just wanting to understand it more.

Question 5 – Linkage

How could one key idea from this week's material be directly applied to your project?

I guess the prolog stuff again I don't think my group will be employing any search and/or optimisation methods in our project, but I'm personally interested in them so it was cool nonetheless.
